

# How to create Pastures from <https://www.google.com/maps/about/mymaps/>

## Carrying Capacity Tool

Step 1: Create a map of your pastures. You can create the map by going to <https://www.google.com/maps/about/mymaps/>

Step 2: Download the .kml file of your pasture map, then upload it below

Step 3: Select your data type (grasscast not available everywhere), calculation type, forage utilization rate, percent of the total forage that is edible, animal type, and forage scenario

Note: This tool is not meant to replace on the ground forage assessments. The forage production in pastures of interest is likely to differ from these estimates and when managing animals, on the ground forage assessments are still needed to ensure proper stocking.

**Import KML file**
